

Elias De Bock

Software Developer

Having started my journey in the wondrous world of web development in 2019, I am ready for the next step in my career. I am an ambitious and passionate full stack web and iOS developer with an eagerness to learn and improve continuously. Looking for an environment to grow and take my skills to the next level.

Education

2019

Web Development Course
BeCode

Experience

- HTML/CSS/Tailwind/SASS
- React/Next
- Node
- CRUD/REST APIs
- Redux Toolkit
- Swift/SwiftUI/SwiftData
- Javascript

Language

English

Dutch

Experience

May 2021 - December 2022

Janssen Pharmaceutica EMEA

Webmaster / Web Analyst (External)

Still working for iO, I received the opportunity to work as a consultant webmaster to help facilitate Janssen EMEA with a CMS migration from Drupal to Contentstack. After completing the migration our team stayed on board to manage and build promotional and medical content on the platforms Janssen Medical Cloud and Janssen With Me in a Kanban environment. I have learned a lot during my time here. Next to webmastering I performed regression tests in UAT, reported bugs, executed test scripts in Jira, scheduled meetings with design agencies to give technical input, helped the BA team with various tickets, wrote documentation in Confluence and also took away some valuable project management skills.

March 2020 - May 2021

iO

Frontend Developer

iO is an end-to-end agency and expert in communication and digital transformation. In the areas of strategy, creation, marketing and technology. Following my internship at Bothive I joined one of their marketing teams in Ghent to develop emails and landing pages for various marketing campaigns. I have worked for companies such as J&J (Benelux, Germany, Spain), Proximus, Bpost. Learned working with tools such as Veeva and Eloqua.

November 2019 - January 2020

Bothive

Internship Junior Full Stack Developer

After following a web development course at BeCode, I had the amazing opportunity to go deeper into the world of coding with a real life full stack environment at Bothive. This covered making a web crawler in Node.js, building UI using React and Redux, learning Node frameworks such as Express along the way. With MongoDB as database. I was here for about 3 months in total, but learned a lot from Brecht and the team.

Projects

Lendert's Garage

An e-commerce store made for my friend to sell items he has in stock using React for the frontend and Airtable to store the products. Made use of additional tools like Context API, axios, react-router-dom and styled-components.

Octane CSS Library

A small css library I have called Octane to learn concepts of SASS such as mixins, loops, functions, @use, @forward, @debug, @extend @include, sass:math and to get my feet wet using Next.js for the first time. Also made a small demo page with the classes I made with SASS.

MERN blog application

A full-stack MERN blog application where users can create an account. Users can then create and update a blog post and view all blog posts.

Project Management Tool GraphQL

A full-stack tool, using MongoDB for the database, graphql-express, Node for the API and Next.js in the frontend. My introduction to GraphQL.

Jobster

An application to track job applications with a simple stats dashboard, Users are able to register and login, next to creating, reading, updating or deleting job applications. Makes use of Redux Toolkit for state management.

GPT-3.5-Turbo Chatbot

A simple chatbot with the GPT-3.5-turbo model integrated using a chat UI kit from Chatscope. Made out of curiosity for the new AI tech and to practice connecting to the API.

Vanilla JS Fundamentals, CSS Layout Practice, Typescript projects

A collection of small vanilla Javascript projects to practice the fundamentals in scoped settings. Also did the same for CSS and its available tools like styled-components and Tailwind CSS. Additionally I also have a repository dedicated to Typescript projects.

Personal portfolio website

A personal website I built to showcase the projects I have been working on. Uses React, Tailwind, Typescript and Vite. Also cool libraries such as ts-particles, framer-motion, react-type-animation and react-router-dom.

Dawn (iOS app)

I personally needed an app to keep track of my weight and amount of exercises I do daily. After doing some research and wondering if I shouldn't use React Native instead, I settled on learning Swift and SwiftUI to build my first iOS app. Users can track meals, exercises, kcal, macros... There are historical overviews (provided by the powerful Chart framework) to track your progress and goals over time, It also includes a photo diary and a weight tracker. Data persistence within the app is powered by SwiftData.
